Continuation of 5. does NOT place the application in condition for allowance because: Ando teaches amorphous hafnium oxide thin film layers on glass or plastic. Lazarov teaches the density of hafnium oxide is between 3.7 and 4.5 g/cm3, meeting the limitation, less than 8 g/cm3, used as an antireflection layer with absorption improvements. Applicant appears to dispute unassailable evidence stating while Ando teaches an amorphous oxide film consisting of Hf, that Ando does not teach HfO2. Ando describes the very oxide Applicant claims, HfO2 and stating "an amorphous oxide... consisting of ...Hf", is one in the same. The 103 rejection is maintained for reasons of record..
